

Reflection of Project

The computer application project was a good experience for me. This project gave me a challenge of informing a person of a type of computer software that is related to construction in some way.

I have used DataCad 8 for one quarter while in college and I learned a great deal from this program. DataCad 8 is a design program to assist architects, engineers, designer, etc. in the area of design or building. I learned that there are many items that are involved in this program. I realize that with the little time that I used it I only scratched the surface of what is in the software package.

This paper was very informative for people that may be looking into buying some type of design software. I believe this program to be very competitive among other design programs that are on the market today. I feel that if I were to invest in a program such as this, it would be DataCad. This program is full of material that makes the design of a building easier, and the time is cut down tremendously.

I enjoyed working with DataCad and am glad to inform people on the aspects of this program.
