

Reflection of Project

I enjoyed researching this project very much. I gave a speech in another class earlier in the quarter about this subject so I was familiar with the topic of engineered wood.

I am also interested in this topic because people use engineered wood for construction everywhere. And this use is becoming more popular and should continue to do so. My brother has experienced this fact in the new house that he is building. His contractor used glu-lam, and engineered floor joist for his log home. My brother had some concerns of this material. With my knowledge that I have gained through this major I was able to answer that questions that he had concerning engineered wood.

I have knowledge of this topic through my basic ACSM (Agricultural and Construction Systems Management) course as well as architectural courses that I have taken at The Ohio State University. I also have knowledge on my own from watching videos on engineered wood and by searching the internet.

Engineered wood is an important aspect of construction today. I have enjoyed researching this product. I hope that this project will help other people learn about the uses of engineered lumber.
